PYRAZOLOQUINOLONE DERIVATIVE AND USE THEREOF

Technical Field

5 The present invention relates to a pyrazoloquinolone derivative which is useful as protein kinase (tyrosine kinase, etc.; in particular, Src) inhibitor, and use thereof.

Background Art

10 A protein kinase transmits signals related to proliferation, intercellular communication, survival and the like, by phosphorylating tyrosine, serine or threonine in the protein itself or in other proteins. Such signals take an important role in proliferation, survival and the like of
15 normal cells. However, genetic mutation, overexpression or activation of a molecule having protein kinase activity in cancer cells causes uncontrollableness of the signals, and leads to abnormal accentuation of the signals. For example, receptor type tyrosine kinases such as EGFR, HER2, IGFR, PDGFR
20 and the like, non-receptor type tyrosine kinases such as Src, FAK, Met and the like, and serine threonine kinase such as Akt, c-raf, MEK and the like are overexpressed or activated in cancer cells, and for example, tyrosine kinases such as EGFR, Abl, Flt-3 and the like, and serine threonine kinase such as
25 b-raf and the like are reported to have genetic mutations (Genes and Development, Vol. 17, p. 2998 (2003)). In addition, when the gene of such a protein kinase is transfected to normal cells and overexpressed, the cells turn into cancer cells. Tumor development, tumor growth and malignant
30 alteration of tumor are closely related to the accentuation of signals by protein kinases. Accordingly, a compound inhibiting protein kinases is believed to be useful as a drug for the prophylaxis and/or treatment of cancer, due to the ability to inhibit the proliferation of cancer cells, or to block the
35 survival signals, and the like.

Abnormal protein kinases are also involved in other various diseases, in addition to cancer. For example, arteriosclerosis is related to the signals from PDGF receptors, etc.; nephritis to the signals from PDGF receptors, etc.; multiple sclerosis to the signals from Lck, etc.; viral diseases such as AIDS to the signals from Mos, etc.; psoriasis to the signals from EGF receptors, etc.; diabetic retinopathy to the signals from VEGF receptors, etc.; rhinitis to the signals from Syk, etc.; asthma to the signals from Syk, JAK3, $I\kappa\kappa\beta$, etc.; glaucoma to the signals from ROCK, etc.; allergic diseases to the signals from Lyn, etc.; cardiac failure to the signals from ROCK, etc.; subarachnoid hemorrhage to the signals from ROCK or Rho, etc.; impotence to the signals from ROCK, etc.; Parkinson's disease to the signals from Jun, etc.; cerebral ischemic disease to the signals from Jun, Src, GSK-3, etc.; ischemic heart diseases such as myocardial infarction, angina pectoris and the like to the signals from p38MAP kinases, etc.; chronic rheumatoid arthritis to the signals from $I\kappa\kappa1$, etc.; thrombosis to the signals from PKC, etc.; obesity to the signals from GSK-3, VEGF receptors, etc.; diabetes mellitus to the signals from GSK-3, etc.; chronic obstructive lung disease to the signals from GSK-3, etc.; osteoporosis to the signals from Src, etc.; and the rejection response associated with transplantation to the signals from Lck, etc. Therefore, such compound inhibiting protein kinases is believed to be useful as a drug for the prophylaxis and/or treatment of these diseases.

The Src family members are non-receptor type tyrosine kinases consisting of at least 9 members (Src, Fyn, Yes, Blk, Yrk, Fgr, Hck, Lck and Lyn) (Annual Review of Cell Development and Biology, Vol. 13, p. 513 (1997)). Among these, Src is in particular highly related to cancer. For example, when the level of Src protein is reduced, tumor growth is inhibited (Cell Growth and Differentiation, Vol. 8, p. 269 (1997)), while when the level of Src protein is increased, tumor growth

is accelerated (Cell Growth and Differentiation, Vol. 8, p. 1287 (1997)). Further, Src has increased activity in colon cancer, breast cancer, pancreatic cancer, ovarian cancer, esophageal cancer, lung cancer, cervical cancer, stomach cancer and the like (Biochimica et Biophysica Acta, Vol. 1602, p. 114 (2002)), and it is reported that cancer with activated Src is highly metastatic and shows poor prognosis (Cancer Research, Vol. 94, p. 344 (2002)). Moreover, when the level of Src protein is reduced in cancer cells, the amount of VEGF produced is decreased (Journal Biological Chemistry, Vol. 273, p. 1052 (1998)). Since Src is involved in the proliferation signals of VEGF in vascular endothelial cells (Molecular cell, Vol. 4, p. 915 (1999)), Src also plays an important role in angiogenesis. Therefore, Src promotes proliferation of cancer cells directly or through angiogenesis, and thus, a compound inhibiting Src is believed to be useful as a drug for the prophylaxis and/or treatment of cancer such as, for example, colon cancer, breast cancer, pancreatic cancer, ovarian cancer, esophageal cancer, lung cancer, cervical cancer, stomach cancer and the like.

In addition, a knock-out mouse lacking Src gene develops marble bones disease, which is a disease caused by the lack of osteoclast activity (Cell, Vol. 64, p. 693 (1991)). It has been found that in such a mouse, there is no change in the number of osteoclast cells, but the function thereof is impaired. Further, the Src expression is high in the osteoclast cells, and osteoporosis develops when the activity of osteoclast cells predominates over the activity of osteoblast cells. Accordingly, a compound inhibiting Src is believed to be useful as a drug for the prophylaxis and/or treatment of osteoporosis. Furthermore, since creation of space inside the bone where cancer cells can proliferate under the activation of osteoclast cells, plays an important role in osseous metastasis, a compound inhibiting Src can be used as a drug for the prophylaxis and/or treatment of osseous

metastasis of cancer cells (Cancer Research, Vol. 63, p. 5028 (2003)).

In the above described reaction, when the starting compound has an amino group, a carboxy group or a hydroxy group as the substituent, protective groups that are generally used in peptide chemistry or the like may be introduced in these groups. The target compound can be obtained by removing the protective group, if necessary, after the reaction. Introduction or removal of these protective groups may be favorably carried out according to a method known per se, for example, the method disclosed in Theodora W. Greene and Peter G. M. In any case, further if necessary, compound (I) can be synthesized by using generally known deprotection reactions, acylation reactions, alkylation reactions, hydrogenation reactions, oxidation reactions, reduction reactions, carbon chain extension reactions, substituent exchange reactions, each alone or in combination of two or more of them. As these reactions, for example, methods described in SHINJIKKEN KAGAKU KOUZA 14, Vol. 15, 1977 (Maruzen Press), etc. are adopted.

When the desired product is obtained in the free form by the above mentioned reaction, it may be converted into a salt according to an ordinary method, while when obtained in the form of a salt, it can also be converted into a free form or other salt according to an ordinary method. With regard to the concomitant use of the compound of the
present invention and a concomitant drug, the compound of the
10 present invention and the concomitant drug are free of any
limitation on the timing of the administration, or the
compound of the present invention and the concomitant drug may
be simultaneously administered to the administration object,
or may be administered with time difference. The dose of the
15 concomitant drug follows a clinical dose and can be
appropriately determined depending on the administration
object, administration route, disease, combination and the
like.

The mode of administration of the compound of the present
20 invention and the concomitant drug is not particularly
limited, as long as the compound of the present invention and
the concomitant drug are combined for administration. The
administration mode may be exemplified by (1) administration
of a single preparation obtained by simultaneously formulating
25 the compound of the present invention and the concomitant
drug, (2) simultaneous administration through the same
administration route of two preparations obtained by
separately formulating the compound of the present invention
and the concomitant drug, (3) administration with a time
30 interval through the same administration route of two
preparations obtained by separately formulating the compound
of the present invention and the concomitant drug, (4)
simultaneous administration through different administration
routes of two preparations obtained by separately formulating
35 the compound of the present invention and the concomitant

drug, (5) administration with a time interval through different administration routes of two preparations obtained by separately formulating the compound of the present invention and the concomitant drug (for example, administration in order of the compound of the present invention and then the concomitant drug, or administration in the reverse order), or the like. Hereinafter, these administration modes are together abbreviated as a 'concomitant agent of the present invention'.

10 The concomitant agent of the present invention has low toxicity and can be administered safely by admixing the compound of the present invention or (and) above-mentioned concomitant drug with, for example, a pharmacologically acceptable carrier according to a method known per se to give
15 a pharmaceutical composition, such as tablets (inclusive of sugar-coated tablets and film-coated tablets), powders, granules, capsules, (inclusive of soft capsules), liquids, injections, suppositories, sustained release agents and the like, for oral or parenteral (e.g., topical, rectal or
20 intravenous administration, etc.) administration. An injection can be administered intravenously, intramuscularly, subcutaneously, intraorgan routely, intranasally, intracutaneously, ocular instillationarily, intracerebrally, intrarectally, intravaginally and interperitoneally,
25 intratumorly, administration nearby-intratumorly, or administration directly to the lesion.

As the pharmacologically acceptable carrier usable for the production of the concomitant agents of the present invention, same substance usable for above-mentioned
30 pharmaceutical composition of the present invention can be used.

The mixing ratio of the compound of the present invention and the concomitant drug, for the concomitant agents of the present invention, can be appropriately selected in accordance
35 with the subject of administration, administration route,

disease and the like.

For example, the content of the compound of the present invention in the concomitant agent of the present invention differs depending on the form of a preparation, and usually
5 from about 0.01 to 100% by weight, preferably from about 0.1 to 50% by weight, and further preferably from about 0.5 to 20% by weight, based on the total amount of the preparation.

The content of the concomitant drug in the concomitant agent of the present invention differs depending on the form
10 of a preparation, and usually from about 0.01 to 100% by weight, preferably from about 0.1 to 50% by weight, and further preferably from about 0.5 to 20% by weight, based on the total amount of the preparation.

The content of additives such as a carrier in the
15 concomitant agent of the present invention differs depending on the form of a preparation, and usually from about 1 to 99.99% by weight, preferably from about 10 to 90% by weight, based on the total amount of the preparation.

In the case when the compound of the present invention
20 and the concomitant drug are separately prepared respectively, the same contents may be adopted.

While the dose of the concomitant agent of the present invention varies depending on the kind of the compound of the present invention, the patient's age, body weight and
25 condition, the dosage form, the mode and the period of the administration, etc., the amount of the compound of the present invention and the concomitant drug may respectively, for example, be generally about 0.01 to about 1000 mg/kg, preferably about 0.01 to about 100 mg/kg, more preferably
30 about 0.1 to about 100 mg/kg, most preferably about 0.1 to about 50 mg/kg, and particularly about 1.5 to about 30 mg/kg per day in a patient with breast cancer (adult weighing about 60 kg), said daily dose being given intravenously all at once or in several portions during a day. It is a matter of course
35 that a lower daily dose may be sufficient or an excessive dose

may be required since the dose may vary depending on various factors as discussed above.

The concomitant drug may be contained in any amount as long as a side effect does not pose a problem. While the daily dose of the concomitant drug may vary depending on the disease state, the age, sex, body weight and difference in sensitivity of the administration object, timing and interval of administration, characteristics, dispensing and kind of the pharmaceutical preparation, the kind of active ingredient and the like and is not particularly limited, the amount of the drug is generally about 0.001 to 2000 mg, preferably about 0.01 to 500 mg, more preferably about 0.1 to 100 mg, per 1 kg body weight of mammal by oral administration, which is generally administered all at once or in 2 to 4 portions during a day.

The concomitant agent of the present invention may be administered at the same time, or the concomitant drug may be administered first, and then the compound of the present invention may be administered. Alternatively, the compound of the present invention may be administered first, and then the concomitant drug may be administered. For time stagger administration, the time difference varies depending on the active ingredient to be administered, dosage form and administration route. For example, when the concomitant drug is to be administered first, the compound of the present invention is administered within 1 min to 3 days, preferably 10 min to 1 day, more preferably 15 min to 1 hour, after the administration of the concomitant drug. When the compound of the present invention is to be administered first, the concomitant drug is administered within 1 min to 1 day, preferably 10 min to 6 hours, more preferably 15 min to 1 hour, after the administration of the compound of the present invention.

In a preferable administration method, for example, the concomitant drug which has been formed into an oral

administration preparation is administered orally at a daily dose of about 0.001 to 200 mg/kg, and about 15 minutes after, the compound of the invention which has been formed into an oral administration preparation is administered orally at a
5 daily dose of about 0.005 to 100 mg/kg.

In addition, pharmaceutical composition of the present invention or a concomitant agent of the present invention can be used in combination with non-drug therapy, for example, (1) surgery, (2) vasopressor chemotherapy using angiotensin II and
10 the like, (3) gene therapy, (4) hyperthermia therapy, (5) freeze therapy, (6) an optical laser burning therapy, (7) radiotherapy, and the like.

For example, by using the pharmaceutical composition of the present invention or the concomitant agent of the present
15 invention before or after a surgery etc., or otherwise before or after a treatment of two or three kinds of those therapies, effects on the prevention of resistance development, elongation of disease-free survival, inhibition of cancer metastasis and recurrence, life lengthening, and the like are
20 obtained.

In addition, a therapy with the pharmaceutical composition of the present invention or a concomitant drug of the present invention, and a support therapy [(i) administration of antibiotics (e.g., β -lactam such as
25 panspoprin, macrolides such as clarithromycin, etc.) against complication of various infections, (ii) administration of intravenous hyperalimentation, amino acid preparation, multivitamin preparation, for improvement in nutritional disorder, (iii) administration of morphine for pain-relief
30 (iv) administration of drugs for improving side effects such as nausea, vomiting, anorexia, diarrhea, leukopenia, thrombocytopenia, reduced haemoglobin concentration, depilation, hepatic disorder, renal disturbance, DIC, and pyrexia, (v) administration of drugs for inhibiting multidrug-resistance in
35 carcinoma, and the like] can also be in combination.

Before or after the above-mentioned treatment, the pharmaceutical composition of the present invention or the concomitant agent of the present invention is preferable to be administered by an oral administration (including sustained-
5 release), an intravenous administration (including bolus, infusion, and clathrate), subcutaneous and intramuscular (including bolus, infusion, and sustained-release), percutaneous, intratumor and intratumor-nearby administration.

Before the surgery and the like, the pharmaceutical
10 composition of the present invention or the concomitant agents of the present invention is administered, for example, about 30 min to 24 hours before the surgery and the like all at once, or is administered about 3 to 6 months before the surgery and the like all at once or in 2 to 3 cycle portions.
15 As such, surgery and the like become easier by administering the pharmaceutical composition of the present invention or the concomitant agent of the present invention before the surgery and the like which for example reduces the carcinoma tissue.

After the surgery and the like, the pharmaceutical
20 composition of the present invention or the concomitant agents of the present invention is administered, for example, about 30 min to 24 hours after the surgery and the like, or for example is administered repeatedly for about several weeks to 3 months term. As such, effects on surgery and the like are
25 increased by administering the pharmaceutical composition of the present invention or the concomitant agents of the present invention after the surgery and the like.

25 **Test Example 1**

Inhibition activity of the test compound for Src tyrosine kinase was measured by the method described as below. p60^{C-Src} (a preparation purified partially, purchased from Upstate Biotechnology, Inc.) was used as an enzyme. A biotin-labeled
30 polypeptide (co-polymer of glutamic acid and tyrosine, glutamic acid:tyrosine = 4:1, purchased from Nihon Schering K. K. (Japan), prepared by CIS Bio International) was used as a substrate. A solution having composition of 50 mM Tris-HCl (pH 7.5), 5 mM of MgCl₂, 5 mM of MnCl₂, 2 mM of dithiothreitol,
35 0.01% of Tween-20 was used as a buffer solution for measuring

the activity of tyrosine-kinase. The amount of phosphorylation of tyrosine in the substrate after the reaction was measured by the method using phosphotyrosine recognition antibody. In the concrete, α -screen phosphotyrosine (p-tyr-100) assay kit
5 (manufactured by PerkinElmer, Inc.) was used. FusionTM (manufactured by PerkinElmer, Inc.) was used as a plate reader. The test compound was dissolved in dimethylsulfoxide, and diluted with the above-mentioned buffer solution for measuring the activity of tyrosine-kinase. To 5 μ l of the
10 solution of test compound was added 10 μ l of a buffer solution containing 75 ng/ml of the enzyme (p60^{c-src}) and 250 ng/ml of the substrate (biotin-labeled polypeptide), and then added 10 μ l of a buffer solution containing 5 μ M ATP, and then the tyrosine-kinase reaction was initiated. Accordingly the
15 tyrosine-kinase reaction was meant by a kinase reaction in a solution containing the test compound having designated concentration, 30 ng/ml of p60^{c-src}, 100ng/ml of polypeptide, 2 μ M of ATP, 50mM of Tris-HCl (pH 7.5), 5 mM of MgCl₂, 5 mM of MnCl₂, 2 mM of dithiothreitol and 0.01% of Tween-20, and the
20 amount of the reaction liquid was 25 μ l. After the reaction was continued at room temperature for 10 minutes, the kinase reaction was terminated by adding 25 μ l of a solution containing 100 mM of EDTA·2 sodium salt (Ethylene Diamine Tetraacetic Acid, disodium salt), 62.5 mM of HEPES (pH 7.4),
25 250 mM of NaCl, 0.1% of Bovine Serum Albumin, 10 μ g/ml of streptavidine donor beads for α -screen assay, 10 μ g/ml of acceptor beads binding anti-phosphotyrosin recognition antibody PY-100 for α -screen assay (Anti-phosphotyrisine(P-Tyr-100) Acceptor beads), and then the binding reaction
30 between phosphotyrosine recognition antibody and phosphorylating tyrosine was continued at room temperature for 16 hours, and then the amount of tyrosine phosphorylation was measured by using plate reader FusionTM. The inhibition rate (%) of the kinase by the test compound was determinated by the
35 equation represented below.

Inhibition rate (%)=100-[(count of the test compound-blank)/(control-blank)]× 100

Wherein, the [control] was defined as the count of the solution which was reacted without adding the compound, the
5 [blank] was defined as the count of the solution which was reacted without adding the compound and ATP.

The concentration of the compound required for 50% inhibition of the enzyme activity (the value of IC₅₀) was calculated with graph analysis software PRISM Ver3.02
10 (prepared by Graphpad software, Inc.).

The compound of Example 37, Example 38, Example 61 and Example 62 were showed the inhibiton activity of 10⁻⁹ M order in IC₅₀ values.
